AMAZON SALES ANALYSIS DASHBOARD

Power BI | Business Intelligence Project Report

1. Project Overview

This project presents an interactive sales analysis dashboard built in Microsoft Power BI. It explores business performance across product categories, sub-categories, customer segments, regions, states, and time. The dashboard brings key metrics and visual comparisons together to support a clear understanding of sales activity and profitability.

2. Key Performance Indicators

2.30M	38K	286.40K	87.03K
Total Sales	Quantity Sold	Total Profit	Shipments

3. Dashboard Components

Category and sub-category analysis: A treemap compares sales and profit across Technology, Furniture, Office Supplies, and their sub-categories.

Customer segment comparison: A matrix compares sales and profit for Consumer and Corporate customers across the main product categories.

Monthly sales trend: A time-series chart displays monthly sales movement from 2014 through 2017, making changes over time easier to inspect.

Geographic and regional analysis: A state-level map visualizes profit distribution, while a regional chart compares sales and profit across West, East, Central, and South.

Discount analysis: A pie chart compares average discount percentages across selected product sub-categories.

Category-level profitability: A separate chart compares profit contributions from Technology, Office Supplies, and Furniture.

4. Initial Observations

• Technology records the largest profit contribution among the three main categories in the dashboard.

• The West region has the highest displayed sales total, followed by East, Central, and South.

• The dashboard shows differences in sales and profit across customer segments and product categories.

• Monthly sales vary over the displayed period, indicating that performance should be reviewed over time rather than from a single total.

• Average discount levels differ across sub-categories, making discounting another useful dimension for business review.

5. Tools and Skills Demonstrated

Tools: Microsoft Power BI, Power Query, DAX.
Skills: Data exploration, KPI reporting, data transformation, data visualization, category and segment analysis, time-series analysis, and regional performance analysis.

6. Project Objective

The objective is to turn a sales dataset into an accessible business intelligence view. The dashboard demonstrates how business data can be organized into KPIs and interactive visuals to help stakeholders explore performance, compare dimensions, and identify areas for further analysis.

Note: Figures and observations in this report are based on the dashboard screenshot provided. The report describes the visible analysis and does not imply that the underlying dataset or Power BI file has been independently audited.
